ABOUT ME

With a focus on Machine Learning Engineering, I have developed projects involving predictive and generative models. I am particularly interested in working with language models and generative AI. I have experience with CI/CD tools and cloud services such as AWS. I aim to contribute to innovative projects that explore cutting-edge technologies and the state of the art in artificial intelligence.

EDUCATION

Universidad Carlos III de Madrid

MSc in Applied Artificial Intelligence

2024 - Present

Universidad Rey Juan Carlos

BSc in Mathematics

2019 - Present

Universidad Rey Juan Carlos

BSc in Computer Science

2019 - 2024

Coursera — DeepLearning AI, Stanford University

Machine Learning Specialization

2023

SKILLS

- Python, Pandas, PyTorch, Jupyter, TensorFlow, Keras, scikit-learn, NumPy
- Teamwork, problem solving, initiative
- NLP, ETL, Feature engineering, Computer vision, Reinforcement learning
- Amazon Web Services, Docker, CI/CD, GitHub, Git
- SQL, MongoDB, Amazon S3
- Java, Spring Boot, Spring Security, Angular

LANGUAGES

- Spanish - Native
- English - C1 Cambridge Advanced

PROFESSIONAL EXPERIENCE

Data Science Internship

Enel Green Power - March 2024 to June 2024

I completed an internship as a Data Scientist at Enel Green Power, where I worked with models in production—researching, optimizing processes, and implementing updates—to predict failures in wind turbines and provide better insights to industrial engineers responsible for monitoring the wind turbines.

The main anomaly detection models I worked with were based on:

- Autoencoders trained on motion sensor data
- Oversampling algorithms and classical unsupervised algorithms applied to lab results from transmission oil samples in wind turbines

Freelance Web Developer — exercise4you.es

Exercise4You - 2024 a 2025

I developed and maintained a web application designed to assist physiotherapists in managing patients and prescribing physical exercise.

This project was carried out as research in collaboration with a PhD candidate in physiotherapy, who acted as the client and defined the specific requirements of the tool as part of his doctoral thesis.

- Client-server architecture, with a frontend developed in Angular and a backend implemented using Spring Boot.
- Deployed in a production environment using Docker and Amazon Web Services (AWS) services, such as EC2, RDS, DocumentDB, S3, Route 53, and Certificate Manager.

PROJECTS

For more information, please refer to my GitHub profile or my personal portfolio website. These are the main projects I have developed:

-  Chatbot using Retrieval-Augmented Generation (RAG) for fact-checking on climate change.
-  Predictive model with explainability for bacterial resistance to antibiotics.
-  Prediction of credit approval and credit risk.
-  Web app with a simple interactive dashboard to visualize F1 data.
